

Yolo Architecture!

Experiment 15:

Implement a YOLO model
to detect objects.

Aim: Demonstrate how to Perform Object detection on Sample Using a Pre-trained CNN model.

Objective:

Loading and understanding the YOLO model that was trained on coco dataset. ✓

Pseudo Code:-

- Import necessary libraries YOLO from ultralytics
- `SET Model = load-yolo-model("yolo_v8n.pt")`
- load the image as a URL from
- Run Prediction
- `SET Confidence - threshold = 0.7`
- `SET results - list = model(image - Pit,`
`Conf = Confidence - threshold)`
- `SET result = results - list[0]`
- Draw detection
- Use built-in `Plot()` method to draw boxes and labels.
- Use return a numpy array in BGR format.

Output:

448x640 1Car, 322.2ms.

Speed = 34.0ms Preprocess, 322.2ms.

inference, 37.6ms Postprocess Per image
at shape (1, 3, 448, 640).

- Convert matplotlib
- Initialize
- End.

Result: a Yolo

~~CV~~

- Convert from BGR to RGB from matplotlib
- Initialize plot and display plot
- End.

Result: ~~successfully~~ detected images using
a ~~Yolo~~ model.

~~CV~~
